

The value of automation

Data pipelines automate various data processes that ingest, transform, and deliver data where it needs to go. Once data has been through a pipeline, it is placed into target tables where users can access it and use it for analysis and visualizations.

For this discussion prompt, consider the following:

Why is automating these data processes useful for BI?

If you could automate a task you do in real life, what would you pick and why? How could you use data to automate this task?
